Project 0-4969: Wireline Communications Design Guidebook
for Intelligent Transportation Systems

Authors: Robert E. Brydia, Byron E. Brackin, Jeremy D. Johnson,
Gary B. Thomas, and Kevin N. Balke

Wireline Communications Workshop for Intelligent Transportation System Applications

Texas Department of Transportation (TxDOT) engineers are responsible for the design, evaluation, and implementation of intelligent transportation system (ITS) solutions across the entire state. These installations occur with vast differences in requirements, expectations, and constraints. Many deployments require some type of communication system to complete the installation.

This project developed a communications design methodology for ITS deployments, a reference guidebook, and training workshop materials. The project goals were to:

- establish a fundamental level of understanding of wireline communications concepts and technologies;

- create, deliver, and explain a comprehensive procedure for assessing communications needs for ITS deployments; and
- create a set of workshop materials for future training program opportunities.

What We Did...

The Basics of Wireline Communications

Researchers first surveyed a variety of literature to determine the most appropriate topics for creating a fundamental base of communications knowledge. Subjects covered in the guidebook and workshop materials included:

- the concept of information;
- analog versus digital;
- the transfer of information;

Figure 1. Media Types Covered in Workshop Materials.

- bits, bytes, and more;
- bandwidth;
- media (shown in [Figure 1](#));
- protocols;
- topologies;
- architecture;
- National Transportation Communications for ITS Protocol (NTCIP); and
- many other topics.

ITS Communications Solutions

Researchers identified the most common technology solutions utilized in the ITS arena. These include:

- serial (RS-232, RS-422, and RS-485),
- Plain Old Telephone System (POTS),
- Integrated Services Digital Network (ISDN),
- Digital Subscriber Line (DSL),
- cable modem,
- T-1/T-3 services,
- Asynchronous Transfer Mode (ATM),
- Synchronous Optical Network (SONET), and
- Ethernet.

Detailed information was provided on each technology choice, covering items such as typical applications, deployment scenarios, costs, bandwidth, and constraints. Of particular usefulness to engineers were the cross-technology tabulations of critical aspects of the communications solutions. Included are such items as:

- bandwidth,
- wiring,
- deployment method,
- distance limitations, and
- typical costs.

Table 1 shows a cross-technology tabulation for bandwidth. The table clearly defines both upload and download speed expectations at both theoretical and usable limits.

Design/Evaluation Methodology

A main result of the project was a design/evaluation methodology, which covers both data and video applications. This methodology provides TxDOT engineers with a systematic procedure for:

- device accounting,
- bandwidth determination,
- evaluation of latency effects,
- suggested communications solutions, and
- typical design and deployment scenarios.

A sample page from the data communications worksheet is shown in Figure 2. Created in a tax table worksheet format, the methodology is straightforward and easy to use.

Table 1. Cross-Technology Tabulation of Bandwidth.

Protocol	Bandwidth			
	Theoretical		Typical (Usable)	
Serial	Up to 115.2 Kbps		19.2 Kbps	
POTS	56 Kbps		40–45 Kbps	
ISDN	BRI – 128 Kbps PRI – 1.544 Mbps		BRI – 128 Kbps PRI – 1.544 Mbps	
DSL	Download	1.544–52.8 Mbps	Download	1–8 Mbps
	Upload	128 Kbps – 4 Mbps	Upload	128 Kbps – 1 Mbps
Cable Modem	Download	1–8 Mbps	Download	1–4 Mbps
	Upload	128 Kbps – 4 Mbps	Upload	128 Kbps – 1 Mbps
T-1/T-3	1.544–44.736 Mbps		1.544–44.736 Mbps	
ATM	1.54–622 Mbps		Up to 500 Mbps	
Ethernet	10 Mbps		4–5 Mbps	
	100 Mbps		40–50 Mbps	
	1000 Mbps		800 Mbps	
	10,000 Mbps		8000 Mbps	
SONET	51.84 Mbps – 39.812 Gbps		51.84 Mbps – 39.812 Gbps	

Workshop Materials

Products of the research project included a comprehensive set of materials for a communications workshop, as shown in Figure 3. A pilot of the workshop was taught and evaluated with extremely high marks for content, delivery, and professionalism of materials. The workshop materials also present case studies of both the data and video methodologies.

What We Found...

The results of this project prove that it is feasible to create and apply a system design/evaluation process for ITS communications needs. This process and the accompanying workshop materials are a solid base that can be built upon by application and case studies.

The Researchers Recommend...

The success of the pilot workshop suggests that there is a strong need for this information and process to be disseminated across the state. Workshop materials are now available for this purpose.

Data Communications Design Worksheet																																																																
Presence of Video Streams (Section 5.4.1)	1.	Are video streams in use now or will they be in the future? <input type="checkbox"/> YES <input type="checkbox"/> NO If 'NO,' proceed to Question 3.			1.																																																											
	2.	Are the video streams and data being transmitted together over the same communications system in the field? <input type="checkbox"/> YES <input type="checkbox"/> NO If 'YES,' you do not need this worksheet, you need the Digital Video Communications Design Worksheet. If 'NO,' proceed to Question 3.			2.																																																											
Number of Devices (Section 5.4.2)	3.	How many of the following devices do you have?			3m.																																																											
				<table border="1"> <thead> <tr> <th colspan="2"></th> <th colspan="2">Number of Devices</th> </tr> <tr> <th></th> <th>Device Type</th> <th>Current</th> <th>Future</th> </tr> </thead> <tbody> <tr> <td>3a.</td> <td>Dynamic Message Signs</td> <td></td> <td></td> </tr> <tr> <td>3b.</td> <td>Vehicle/Roadway Detectors</td> <td></td> <td></td> </tr> <tr> <td>3c.</td> <td>TxDOT LCU</td> <td></td> <td></td> </tr> <tr> <td>3d.</td> <td>TxDOT SCU</td> <td></td> <td></td> </tr> <tr> <td>3e.</td> <td>RWIS</td> <td></td> <td></td> </tr> <tr> <td>3f.</td> <td>Weather Stations</td> <td></td> <td></td> </tr> <tr> <td>3g.</td> <td>Ramp Meters</td> <td></td> <td></td> </tr> <tr> <td>3h.</td> <td>PTZ Camera</td> <td></td> <td></td> </tr> <tr> <td>3i.</td> <td>Traffic Controllers</td> <td></td> <td></td> </tr> <tr> <td>3j.</td> <td>Other</td> <td></td> <td></td> </tr> <tr> <td>3k.</td> <td colspan="2" style="text-align: right;"><i>Subtotals</i></td> <td></td> <td></td> </tr> <tr> <td>3l.</td> <td colspan="2">TOTAL NUMBER OF DATA STREAMS (Add 3k CURRENT + 3k FUTURE)</td> <td></td> <td></td> </tr> </tbody> </table>				Number of Devices			Device Type	Current	Future	3a.
